Review of GHC and its development process

The Glasgow Haskell Compiler

- Haskell compiler
- Website: www.haskell.org/ghc/
- GHC Steering Committee and GHC proposals:
github.com/ghc-proposals/ghc-proposals
- The Glasgow Haskell Team (committers & contributors):
ghc.haskell.org/trac/ghc/wiki/TeamGHC
- Developed since 1990s

Key GHC developers

Simon Peyton Jones

Simon Marlow

The Glasgow Haskell Compiler, Marlow and Peyton Jones, 2012:

While the ultimate goal for us, the main developers of GHC, is to produce research rather than code, we consider developing GHC to be an essential prerequisite: the artifacts of research are fed back into GHC, so that GHC can then be used as the basis for further research that builds on these previous ideas.

Welcome to the GHC Developer Wiki

This is the home for GHC developers. If you're only interested in using GHC, then you probably want the [GHC home page](#). If you are an aspiring GHC developer, and just want to get started, read the [Newcomers page](#) (which is always in the sidebar under "Joining in").

Please help improve the GHC developer's wiki

Please help us improve the information on the GHC developer's wiki. You can easily do this by editing the wiki directly. Just [register](#) an account, and then edit away. Alternatively, [log in](#) as user **guest** with password **guest** (but we'd prefer you to create an account, because it enables us to contact you if necessary). The [Help/Guide](#) link at the top of every page gives a good description of the markup language and how to use Trac in general.

ghc.haskell.org/trac/ghc/

What you can find in the Developers Wiki

- Newcomers info
- Building
- How to work on GHC
- Implementation details: The GHC Commentary
- Advice on debugging, testing, and profiling
- Issues (bugs, feature-requests, tasks)

- Memory management (garbage collection, STM primitives)
- Threads management
- Implementation of primitive operations
- Bytecode interpreter and GHCi dynamic linker

- Memory management (garbage collection, STM primitives)
- Threads management
- Implementation of primitive operations
- Bytecode interpreter and GHCi dynamic linker

The most of these components are implemented in C.

```
bravit@:ghc$ inplace/bin/ghc-stage2 -V  
The Glorious Glasgow Haskell  
Compilation System,  
version 8.5.20180603
```

```
https://ghc.haskell.org/trac/ghc/  
wiki/Newcomers#Firststeps
```

Building steps

1. Prepare workstation (ghc, perl, gcc, make, happy, alex, autoconf, automake, python3, python-sphinx, libedit, ncurses, ...)
2. Get sources
3. `./configure`
4. `make` (this builds stage1, stage2 [, stage3] GHC compilers)

Building steps

1. Prepare workstation (ghc, perl, gcc, make, happy, alex, autoconf, automake, python3, python-sphinx, libedit, ncurses, ...)
2. Get sources
3. `./configure`
4. `make` (this builds stage1, stage2 [, stage3] GHC compilers)

The rule of GHC directory tree reading:

if you see unknown file type, then it comes from build system (99%-guaranteed)

Alternative build system Hadrian

- Andrey Mokhov (Newcastle University, UK)
- github.com/snowleopard/hadrian
- Video: skillsmatter.com/skillscasts/8722-meet-hadrian-a-new-build-system-for-ghc
- Implemented in Haskell, uses Shake (Neil Mitchell, shakebuild.com/)

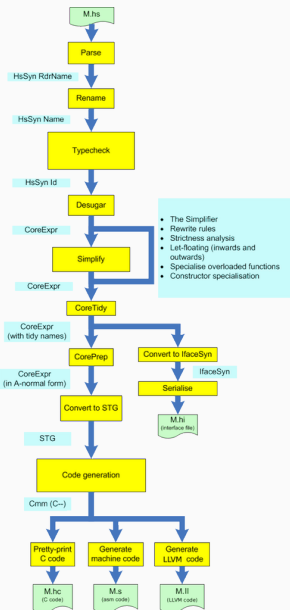

- First steps
- How to rebuild modified code quickly
- How to find an issue (“low-hanging fruits”)
- Advice and links

Don't get scared. GHC is a big codebase, but it makes sense when you stare at it long enough!

Haskell module compilation pipeline

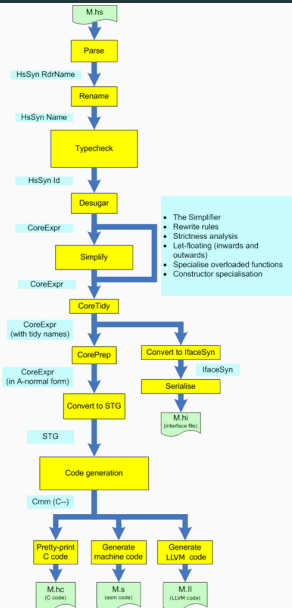

- Compilation manager
- The Haskell Compiler, Hsc
- Driver (composing Hsc with C preprocessor, assembler, linker, etc)

The Haskell Compiler

1. Parser (lexical and syntax analysis)
2. Renamer
3. Type checker
4. Desugarer
5. Optimizer
6. Code generator

Compilation pipeline (1)

- HsSyn – Abstract Syntax Tree (AST).
- RdrName, Name – names with additional info.

```
data HsModule name
= HsModule {
    hsmodName  :: Maybe
                (Located ModuleName),
    hsmodExports :: Maybe
                (Located [LIE name]),
    hsmodImports :: [LImportDecl name],
    hsmodDecls  :: [LHsDecl name],
    -- ...
}
```

```
type LHsDecl id = Located (HsDecl id)
```

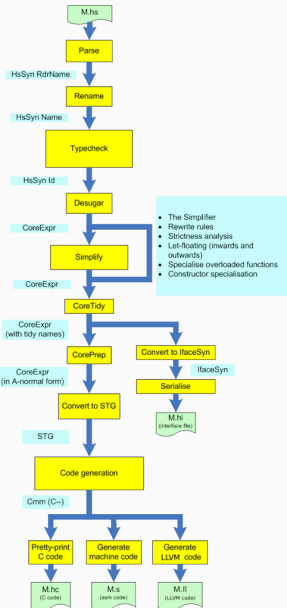

```
data HsDecl id  
  = TyClD      (TyClDecl id)  
  | InstD      (InstDecl id)  
  | DerivD     (DerivDecl id)  
  | ValD       (HsBind id)  
  | SigD       (Sig id)  
  | DefD       (DefaultDecl id)  
  | ForD       (ForeignDecl id)
```

...

. . .

	WarningD	(WarnDecls id)
	AnnD	(AnnDecl id)
	RuleD	(RuleDecls id)
	VectD	(VectDecl id)
	SpliceD	(SpliceDecl id)
	DocD	(DocDecl)
	RoleAnnotD	(RoleAnnotDecl id)

Compilation pipeline (2): type checking

- Id—name with type (every expression has type at this step—either explicitly specified, or inferred)

Compilation pipeline (3): Core and optimisations

- Desugaring = converting to intermediate language (GHC Core)
- Optimisation

Type CoreExpr

```
type CoreBndr = Var
```

```
type CoreExpr = Expr CoreBndr
```

```
data Expr b
```

```
  = Var      Id
```

```
  | Lit      Literal
```

```
  | App      (Expr b) (Arg b)
```

```
  | Lam      b (Expr b)
```

```
  | Let      (Bind b) (Expr b)
```

```
  | Case     (Expr b) b Type [Alt b]
```

```
  | Cast     (Expr b) Coercion
```

```
  | Tick     (Tickish Id) (Expr b)
```

```
  | Type     Type
```

```
  | Coercion Coercion
```

```
type Arg b = Expr b
type Alt b = (AltCon, [b], Expr b)
data AltCon = DataAlt DataCon
            | LitAlt Literal
            | DEFAULT
data Bind b = NonRec b (Expr b)
            | Rec [(b, (Expr b))]
```

GHC Core syntax: expressions and patterns

t, e, u	$::=$	x	Variable
		k	Literal
		$\lambda x : \sigma. e$	Abstraction
		$e \ u$	Application
		$\text{let } \overline{x : \tau = e} \text{ in } u$	Local binding
		$\text{case } e \text{ of } \overline{p \rightarrow u}$	Case expression
		$e \triangleright \gamma$	Type casting
		τ	Type
		$[\gamma]$	Type coercion
p	$::=$	$K \ \overline{c : \eta} \ \overline{x : \tau}$	Patterns

- Overline—list of subterms

$$\begin{array}{lcl} \tau, \kappa, \sigma, \phi & ::= & \\ & | & n \\ & | & \tau_1 \tau_2 \\ & | & T \overline{\tau_i}^i \\ & | & \tau_1 \rightarrow \tau_2 \\ & | & \forall n. \tau \\ & | & \text{lit} \\ & | & \tau \triangleright \gamma \\ & | & \gamma \end{array}$$

- Simplifier
- Term rewriting rules
- Strictness analysis
- Overloading specialisation
- ...

```
f a b = a + b  
main = print $ f 2 3
```

```
f a b = a + b
```

```
main = print $ f 2 3
```

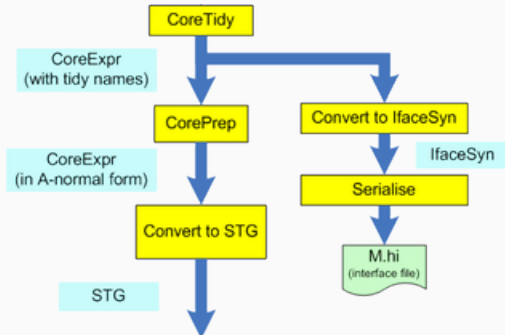

```
$ ghc -c ex.hs -ddump-simpl
```

```
main :: IO ()
[GblId, Str=DmdType]
main =
  print
    @ Integer
    GHC.Show.$fShowInteger
    (+ @ Integer
      GHC.Num.$fNumInteger
      2 3)
```

Marlow and Peyton Jones, 2012:

*In practice Core has been incredibly stable: over a 20-year time period we have added exactly one new major feature to Core (namely coercions and their associated casts). Over the same period, the source language has evolved enormously. We attribute this stability not to our own brilliance, but rather to the fact that Core is based directly on foundational mathematics: **bravo Girard!***

Compilation pipeline (4): prepare to code generation

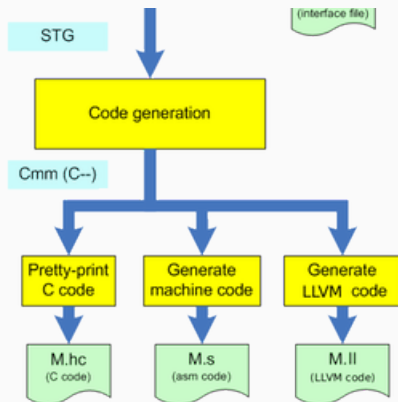

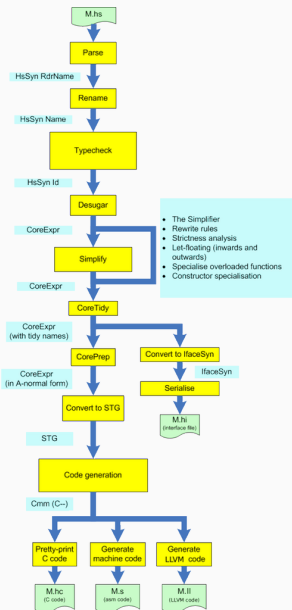

- Constructing *normal form*
- Generating interface files (for cross-module optimisations).
- STG – Spineless Tagless G-machine

STG code fragment

```
sat_s10R :: GHC.Integer.Type.Integer
[LclId, Str=DmdType] =
  \u srt:SRT:[rp0 :-> GHC.Num.$fNumInteger] []
    let {
      sat_s10Q [Occ=Once] ::
        GHC.Integer.Type.Integer
        [LclId, Str=DmdType] =
          NO_CCS GHC.Integer.Type.S#! [3#]; } in
    let {
      sat_s10P [Occ=Once] ::
        GHC.Integer.Type.Integer
        [LclId, Str=DmdType] =
          NO_CCS GHC.Integer.Type.S#! [2#];
    } in  GHC.Num.+ GHC.Num.$fNumInteger
      sat_s10P sat_s10Q;
```

```
Main.main :: GHC.Types.IO ()
[GblId, Str=DmdType] =
  \u srt:SRT:[0B :-> System.IO.print,
    rLs :-> GHC.Show.$fShowInteger,
    s10R :-> sat_s10R] []
System.IO.print GHC.Show.$fShowInteger sat_s10R;
```

Compilation pipeline (5): code generation

- Cmm – low-level imperative language with explicit stack

Cmm code fragment

```
I64[(old + 24)] = stg_bh_upd_frame_info;
I64[(old + 16)] = _c10Y::I64;
I64[Hp - 24] = GHC.Integer.Type.S#_con_info;
I64[Hp - 16] = 3;
_c111::P64 = Hp - 23;
I64[Hp - 8] = GHC.Integer.Type.S#_con_info;
I64[Hp] = 2;
_c112::P64 = Hp - 7;
R2 = GHC.Num.$fNumInteger_closure;
I64[(old + 48)] = stg_ap_pp_info;
P64[(old + 40)] = _c112::P64;
P64[(old + 32)] = _c111::P64;
call GHC.Num.+_info(R2) args: 48, res: 0, upd: 24;
```

- Bytecode
- Native code
- C-code
- LLVM IR (LLVM intermediate representation)

- User-defined rewriting rules
- Compiler plugins
- GHC as a library (GHC API)

```
{-# RULES "fold/build"
  forall k z (g::forall b.
                (a->b->b) -> b -> b) .
    foldr k z (build g) = g k z
#-}
```

- Semantically correct transformation (should be proved somehow outside GHC)

- Plugin is a single optimisation step iteration—a function from Core to Core
- Enabling by ghc option or source code pragma
- Plugin annotations to specify exactly when to run transformation

- Steps modularity
- Every step is a function
- Compiler can be part of a user application

Simon L. Peyton Jones, The implementation of functional programming languages. 1987. 445 pp.

- Part 1. Compiling high-level functional languages
- Part 2. Graph reduction
- Part 3. Advanced graph reduction

Untyped λ -calculus

Types and programming languages, Pierce, 2002

Syntax

t	$::=$	<i>terms:</i>
x		<i>variable</i>
$\lambda x. t$		<i>abstraction</i>
$t \ t$		<i>application</i>

v	$::=$	<i>values:</i>
$\lambda x. t$		<i>value-abstraction</i>

Evaluation (operational semantics)

$$\boxed{t \rightarrow t'}$$

$$\frac{t_1 \rightarrow t'_1}{t_1 \quad t_2 \rightarrow t'_1 \quad t_2}$$

(E-App1)

$$\frac{t_2 \rightarrow t'_2}{v_1 \quad t_2 \rightarrow v_1 \quad t'_2}$$

(E-App2)

$$(\lambda x. t_{12}) \quad v_2 \rightarrow [x \mapsto v_2] t_{12}$$

(E-AppAbs)

Possible extensions

- Boolean constants with operations
- Natural numbers with operations
- Pairs, records, lists

Possible extensions

- Boolean constants with operations
- Natural numbers with operations
- Pairs, records, lists

Options

- Coding these notions in λ -calculus itself
- Adding new constructs

[https://github.com/bravit/
tt-ghc-exercises](https://github.com/bravit/tt-ghc-exercises)

```
$ stack build
```

```
$ stack exec untyped -- untyped/test.f
```

Simply typed λ -calculus (STLC, $\lambda \rightarrow$)

Syntax

$t ::=$

x

$\lambda x:T. t$

$t\ t$

terms:

variable

abstraction

application

$v ::=$

$\lambda x:T. t$

values:

value-abstraction

$T ::=$

$T \rightarrow T$

types:

function type

$\Gamma ::=$

\emptyset

$\Gamma, x:T$

contexts:

empty context

binding term variable

Evaluation

$$\boxed{t \rightarrow t'}$$

$$\frac{t_1 \rightarrow t'_1}{t_1 \ t_2 \rightarrow t'_1 \ t_2} \quad (\text{E-App1})$$

$$\frac{t_2 \rightarrow t'_2}{v_1 \ t_2 \rightarrow v_1 \ t'_2} \quad (\text{E-App2})$$

$$(\lambda \ x : T_{11} . t_{12}) \ v_2 \rightarrow [x \mapsto v_2] t_{12} \quad (\text{E-Abs})$$

$$\frac{x : T \in \Gamma}{\Gamma \vdash x : T}$$

(T-Var)

$$\frac{\Gamma, x:T_1 \vdash t_2 : T_2}{\Gamma \vdash \lambda x:T_1. t_2 : T_1 \rightarrow T_2}$$

(T-Abs)

$$\frac{\Gamma \vdash t_1 : T_{11} \rightarrow T_{12} \quad \Gamma \vdash t_2 : T_{11}}{\Gamma \vdash t_1 t_2 : T_{12}}$$

(T-App)

- Basic types (Bool, Nat,...)
- Constants and operations for basic types (true, false, if/then/else, 0, succ, pred, iszero)
- Evaluation and typing rules

New typing rules

$$\boxed{\Gamma \vdash t : T}$$

$$\vdash \text{true} : \text{Bool} \quad (\text{T-True})$$

$$\vdash \text{false} : \text{Bool} \quad (\text{T-False})$$

$$\frac{\Gamma \vdash t_1 : \text{Bool} \quad \Gamma \vdash t_2 : T \quad \Gamma \vdash t_3 : T}{\Gamma \vdash \text{if } t_1 \text{ then } t_2 \text{ else } t_3 : T} \quad (\text{T-If})$$

$$\vdash 0 : \text{Nat}$$

(T-Zero)

$$\frac{\Gamma \vdash t_1 : \text{Nat}}{\Gamma \vdash \text{succ } t_1 : \text{Nat}}$$

(T-Succ)

$$\frac{\Gamma \vdash t_1 : \text{Nat}}{\Gamma \vdash \text{pred } t_1 : \text{Nat}}$$

(T-Pred)

$$\frac{\Gamma \vdash t_1 : \text{Nat}}{\Gamma \vdash \text{iszero } t_1 : \text{Bool}}$$

(T-IsZero)

Type inference trees: Example

$$\frac{\frac{\frac{x:\text{Bool} \in x:\text{Bool}}{x:\text{Bool} \vdash x:\text{Bool}} \text{ T-Var} \quad \vdash \lambda x:\text{Bool}.x : \text{Bool} \rightarrow \text{Bool} \text{ T-Abs} \quad \vdash \text{true} : \text{Bool} \text{ T-True}}{\vdash (\lambda x:\text{Bool}.x) \text{ true} : \text{Bool}} \text{ T-App}$$

Safety = progress + preservation

Safety = progress + preservation

- Progress: correctly typed term is either value or can be further evaluated
- Preservation: if correctly typed term is evaluated then resulting term is correctly typed

Other typing relation properties

- Inversion lemmas (reversing typing rules)
- Type is uniquely identified
- Canonical forms (`succ (succ (succ 0))`)
- Preserving types in substitution
- Shuffling and weakening contexts
- Normalization
- Explicit and implicit typing

Types are not used during evaluation so they can be erased

Types are not used during evaluation so they can be erased

$$\text{erase}(x) = x$$

$$\text{erase}(\lambda x:T_1. t_2) = \lambda x. \text{erase}(t_2)$$

$$\text{erase}(t_1 \ t_2) = \text{erase}(t_1) \text{erase}(t_2)$$

Types are not used during evaluation so they can be erased

$$\text{erase}(x) = x$$

$$\text{erase}(\lambda x:T_1. t_2) = \lambda x. \text{erase}(t_2)$$

$$\text{erase}(t_1 \ t_2) = \text{erase}(t_1) \text{erase}(t_2)$$

Property: evaluation commutes with erasing

$$\frac{\Gamma, X \vdash t_2 : T_2}{\Gamma \vdash \lambda X. t_2 : \forall X. T_2}$$

(T-TAbs)

$$\frac{\Gamma \vdash t_1 : \forall X. T_{12}}{\Gamma \vdash t_1 [T_2] : [X \mapsto T_2] T_{12}}$$

(T-TApp)

- Progress and preservation

- Progress and preservation
- Normalization

- Progress and preservation
- Normalization
- We need `fix` to define non-normalized functions

- Progress and preservation
- Normalization
- We need `fix` to define non-normalized functions
- Possibility of type erasure

- Progress and preservation
- Normalization
- We need `fix` to define non-normalized functions
- Possibility of type erasure
- (!!!) type reconstruction is undecidable

- Limited System F: prenex polymorphism (type variables range over types without quantifiers), rank 2 polymorphism

- Limited System F: prenex polymorphism (type variables range over types without quantifiers), rank 2 polymorphism
- Impredicativity (quantified variable can be defined object itself)

Practising with System F: Haskell

```
double :  $\forall X. (X \rightarrow X) \rightarrow X \rightarrow X$ 
```

```
double =  $\lambda X. \lambda f:X \rightarrow X. \lambda a:X. f (f a)$ 
```

```
quadruple =  $\lambda X. \text{double } [X \rightarrow X]$   
            ( $\text{double } [X]$ )
```

Practising with System F: Haskell

```
double :  $\forall X. (X \rightarrow X) \rightarrow X \rightarrow X$   
double =  $\lambda X. \lambda f:X \rightarrow X. \lambda a:X. f (f a)$ 
```

```
quadruple =  $\lambda X. \text{double } [X \rightarrow X]$   
           ( $\text{double } [X]$ )
```

```

```
quadruple_rrY :: forall a. (a -> a) -> a -> a
quadruple_rrY
  = \ (@ a_ayv) ->
    double_rpX @ (a_ayv -> a_ayv)
      (double_rpX @ a_ayv)
```

System $F_\omega (\lambda \omega)$

$$\text{Id} = \lambda X. X$$

Functions over types, kinds

$\text{Id} = \lambda X. X$

$\text{Id} = \lambda X::*. X$

Functions over types, kinds

$\text{Id} = \lambda X. X$

$\text{Id} = \lambda X::*. X$

$\text{Pair} = \lambda A::*. \lambda B::*. \forall X. \\ (A \rightarrow B \rightarrow X) \rightarrow X$

Functions over types, kinds

$\text{Id} = \lambda X. X$

$\text{Id} = \lambda X::*. X$

$\text{Pair} = \lambda A::*. \lambda B::*. \forall X. \\ (A \rightarrow B \rightarrow X) \rightarrow X$

$\text{Pair} :: * \rightarrow * \rightarrow *$

Functions over types, kinds

$\text{Id} = \lambda X. X$

$\text{Id} = \lambda X::*. X$

$\text{Pair} = \lambda A::*. \lambda B::*. \forall X.$
 $\quad (A \rightarrow B \rightarrow X) \rightarrow X$

$\text{Pair} :: * \rightarrow * \rightarrow *$

$\text{PairNB} = \text{Pair} \text{ [Nat] [Bool]}$

- Kinds: $*$, $* \rightarrow *$, $* \rightarrow * \rightarrow *$, ...
- Kinding relation (kind assignment) $\Gamma \vdash T :: K$
- Definitional equality ($S \equiv T$):
 $\text{Id Nat} \rightarrow \text{Id Bool} \equiv \text{Nat} \rightarrow \text{Bool}$
- Parallel reduction: directed version of definitional equality

$$\frac{\Gamma, X::K_1 \vdash T_2::K_2}{\Gamma \vdash \Lambda X::K_1. T_2 \quad :: \quad K_1 \rightarrow K_2} \quad (\text{K-Abs})$$

$$\frac{\Gamma, X::K_1 \vdash T_2::*}{\Gamma \vdash \forall X::K_1. T_2 \quad :: \quad *} \quad (\text{K-All})$$

$$\frac{S_2 \equiv T_2}{\forall X::K_1. S_2 \equiv \forall X::K_1. T_2} \quad (\text{Q-All})$$

Modifications in typing rules (fragment)

$$\frac{\Gamma, X:: K_1 \vdash t_2 : T_2}{\Gamma \vdash \lambda X:: K_1. t_2 : \forall X:: K_1. T_2} \quad (\text{T-TAbs})$$

$$\frac{\begin{array}{c} \Gamma \vdash t_1 : \forall X:: K_{11}. T_{12} \\ \Gamma \vdash T_2 :: K_{11} \end{array}}{\Gamma \vdash t_1 [T_2] : [X \mapsto T_2] T_{12}} \quad (\text{T-TApp})$$

$$\frac{\Gamma \vdash t : S \quad S \equiv T \quad \Gamma \vdash T :: *}{\Gamma \vdash t : T} \quad (\text{T-Eq})$$

- Untyped λ -calculus
- Simply typed λ -calculus
- System F
- System F_ω

For many years, GHC's intermediate language was essentially:

- System Fw, plus*
- algebraic data types (including existentials)*

But that is inadequate to describe GADTs and associated types. So in 2006 we extended GHC to support System FC, which adds

- equality constraints and coercions*

GHC Commentary: The Compiler

Algebraic data types: Haskell

```
data Point x = Point x x
```

```
{-# NOINLINE xCoord #-}
```

```
xCoord (Point x _) = x
```

```
yCoord (Point _ y) = y
```

```
main = print $ xCoord (Point 2 3)
```

Algebraic data types: GHC Core

```
xCoord_rq1 :: forall x. Point x -> x
xCoord_rq1
  = \ (@ x_a1dk) (ds_d1y8 :: Point x_a1dk) ->
      case ds_d1y8 of { Point x1_as6 ds1_d1ye
                        -> x1_as6 }

main :: IO ()
main
  = print
    @ Integer
    GHC.Show.$fShowInteger
    (xCoord_rq1 @ Integer
      (Main.Point @ Integer 2 3))
```

Intermediate language GHC Core in System F_ω period

t, e, u	$::=$	x	Variables

Generalized algebraic datatypes and associated types, System FC

[Peyton Jones et al., 2006; Schrijvers et al., 2009]

```
data Exp a where
```

```
  Zero  :: Exp Int
```

```
  Succ  :: Exp Int -> Exp Int
```

```
  Pair  :: Exp b -> Exp c -> Exp (b, c)
```

```
eval :: Exp a -> a
eval Zero = 0      -- Int
eval (Succ e) = eval e + 1  -- Int
eval (Pair x y) = (eval x, eval y)
                  -- (b, c)
```

```
eval :: Exp a -> a
eval Zero = 0      -- Int
eval (Succ e) = eval e + 1  -- Int
eval (Pair x y) = (eval x, eval y)
                  -- (b, c)

res = eval (Pair (Succ Zero) Zero)
```

```
eval :: Exp a -> a
eval Zero = 0      -- Int
eval (Succ e) = eval e + 1  -- Int
eval (Pair x y) = (eval x, eval y)
                                   -- (b, c)

res = eval (Pair (Succ Zero) Zero)
      -- (Int, Int)
```

[Sulzmann et al., 2007, rewritten in 2009–2011]

- Current context contains two syntactically different types (say, `a` and `Int`) which are in fact the same types (are *coercible*)

[Sulzmann et al., 2007, rewritten in 2009–2011]

- Current context contains two syntactically different types (say, `a` and `Int`) which are in fact the same types (are *coercible*)
- We introduce *coercion*, some evidence of *coercibility*, into the context

[Sulzmann et al., 2007, rewritten in 2009–2011]

- Current context contains two syntactically different types (say, `a` and `Int`) which are in fact the same types (are *coercible*)
- We introduce *coercion*, some evidence of *coercibility*, into the context
- Now it is safe to do type *cast*

data Exp a where

Zero : $\forall a. (a \sim \text{Int}) \Rightarrow \text{Exp } a$

Succ : $\forall a. (a \sim \text{Int}) \Rightarrow$
 $\text{Exp Int} \rightarrow \text{Exp } a$

Pair : $\forall abc. (a \sim (b, c)) \Rightarrow$
 $\text{Exp } b \rightarrow \text{Exp } c \rightarrow \text{Exp } a$

- **Zero** has additional argument—evidence of coercibility of **a** to **Int**
- **Exp** is regular ADT now

zero : Exp Int

zero = Zero ???

zero : Exp Int

zero = Zero ???

- reflexivity: any type is a coercion to itself

```

eval  : Exp a -> a
eval =
   $\Lambda a : * . \lambda x : \text{Exp } a .$ 
    case x of
      Zero (co : a ~ Int) -> 0  $\blacktriangleright$  sym co
      ...

```

- cast operator: \blacktriangleright
- symmetry in coercion:
 $(\text{sym } co : \text{Int} \sim a)$
- \blacktriangleright casts to the right hand side of \sim

```

eval : Exp a -> a
eval =
   $\lambda a : *. \lambda x : \text{Exp } a .$ 
    case x of
      Zero (co :  $a \sim \text{Int}$ ) -> 0  $\blacktriangleright$  sym co
      ...

```

- cast operator: \blacktriangleright
- symmetry in coercion:
 $(\text{sym } co : \text{Int} \sim a)$
- \blacktriangleright casts to the right hand side of \sim
- Why coercion is a type and not a value?

```
class Collects c where
  type Elem c
  empty    :: c
  insert   :: Elem c -> c -> c

instance Eq e => Collects [e] where
  type Elem [e] = e
  ...

instance Collects BitSet where
  type Elem BitSet = Char
  ...
```

```
foo :: Char -> BitSet  
foo x = insert x empty
```

Original type classes and instances implementation

- Type class is translated into record (ADT with one constructor, dictionary)
- Every class method becomes record's field
- Instance is a value of this record, fields are methods' implementations
- Every function with this constraint receives additional argument—the dictionary with an implementation

Original type classes and instances implementation

- Type class is translated into record (ADT with one constructor, dictionary)
- Every class method becomes record's field
- Instance is a value of this record, fields are methods' implementations
- Every function with this constraint receives additional argument—the dictionary with an implementation
- Record cannot contain types!

Implementation in GHC Core (System FC)

Type class (Haskell)

```
class Collects c where
  type Elem c
  empty    :: c
  insert :: Elem c -> c -> c
```

Abstract type constructor and type of dictionary (Core)

```
type Elem : * -> *
data CollectsDict c =
  Collects {empty : c;
            insert : Elem c -> c -> c}
```

Instance (Haskell)

```
instance Collects BitSet where  
  type Elem BitSet = Char  
  ...
```

Coercion axiom and dictionary (Core)

```
axiom elemBS : Elem BitSet ~ Char  
  
dCollectsBS : CollectsDict Bitset  
dCollectsBS = ...
```

Method call (Haskell)

```
foo :: Char -> BitSet  
foo x = insert x empty
```

Function call (GHC Core)

```
foo : Char -> BitSet  
foo =  
    λx:Char. insert [BitSet] dCollectBS  
        (x ► sym elemBS)  
        (empty [BitSet] dCollectBS)
```

```
axiom elemBS : Elem BitSet ~ Char
```

- Coercions as types and arguments passing in System F style, erasability
- Operators over coercions (sym etc.) and their normalization
- Abstract type constructors and axioms
- Typing and kinding rules
- Progress and preservation
- Operational semantics
- Erasure properties
- Rules for translation from Haskell

Bugs in type-level computations and System FC₂

Deriving instances for **newtype**

GHC extension GeneralizedNewtypeDeriving

```
newtype Age = MkAge { unAge :: Int }  
class Idea a where  
    good :: a -> a  
instance Idea Int where  
    good = (+1)  
deriving instance Idea Age
```

Deriving instances for **newtype**

GHC extension GeneralizedNewtypeDeriving

```
newtype Age = MkAge { unAge :: Int }
```

```
class Idea a where
```

```
    good :: a -> a
```

```
instance Idea Int where
```

```
    good = (+1)
```

```
deriving instance Idea Age
```

```
axiom CoMkAge : Age ~ Int
```

axiom CoMkAge : Age \sim Int

Question

Let T is a function over types. What about
T Age \sim T Int?

Deriving instances in the presence of type-level functions

```
newtype Age = MkAge { unAge :: Int }
```

```
type family Inspect x
```

```
type instance Inspect Age = Int
```

```
type instance Inspect Int = Bool
```

```
class BadIdea a where
```

```
    bad :: a -> Inspect a
```

```
instance BadIdea Int where
```

```
    bad = (> 0)
```

```
deriving instance BadIdea Age
```

Which type is it?

```
bad (MkAge 5)
```

Which type is it?

```
bad (MkAge 5) :: Int
```

Which type is it?

```
bad (MkAge 5) :: Int
```

What GND builds?

```
axiom CoMkAge : Age ~ Int
```

Which type is it?

```
bad (MkAge 5) :: Int
```

What GND builds?

```
axiom CoMkAge : Age ~ Int
```

GND would use implementation (>0) from
instance for **Int**

Which type is it?

```
bad (MkAge 5) :: Int
```

What GND builds?

```
axiom CoMkAge : Age ~ Int
```

GND would use implementation (>0) from
instance for **Int** so we'd access internal **Bool**
representation! Congrats!

Which type is it?

```
bad (MkAge 5) :: Int
```

What GND builds?

```
axiom CoMkAge : Age ~ Int
```

GND would use implementation (>0) from
instance for **Int** so we'd access internal **Bool**
representation! Congrats!

```
Inspect Age  $\not\sim$  Inspect Int
```

Which type is it?

```
bad (MkAge 5) :: Int
```

What GND builds?

```
axiom CoMkAge : Age ~ Int
```

GND would use implementation (>0) from
instance for **Int** so we'd access internal **Bool**
representation! Congrats!

Inspect Age $\not\sim$ Inspect Int

But Maybe Age \sim Maybe Int

Which type is it?

```
bad (MkAge 5) :: Int
```

What GND builds?

```
axiom CoMkAge : Age ~ Int
```

GND would use implementation (>0) from instance for **Int** so we'd access internal **Bool** representation! Congrats!

Inspect Age $\not\sim$ Inspect Int

But Maybe Age \sim Maybe Int

Problem

When is it OK to lift \sim ?

[Weirich et al., 2011; *Roles (GHC Dev wiki)*]

Type can play different roles:

- encoding
- representation

[Weirich et al., 2011; *Roles (GHC Dev wiki)*]

Type can play different roles:

- encoding
- representation

Here come different equalities:

- nominal equality (up to type synonyms)
- representational equality

Parametric and non-parametric type var occurrences

```
data List a = Nil | Cons a (List a)
data GADT a where
    GAge :: GADT Age
    GInt :: GADT Int
class C1 a where
    foo :: a -> List a
class C2 a where
    bar :: a -> GADT a
class BadIdea a where
    bad :: a -> Inspect a
```

- If type variable has parametric occurrence then we may lift \sim in case of representational equality
- Otherwise, lifting is allowed only in case of nominal equality

- If type variable has parametric occurrence then we may lift \sim in case of representational equality
- Otherwise, lifting is allowed only in case of nominal equality

Question

What is the right place for type roles?

$k ::= * \mid k' \rightarrow k$

kinds

$R ::= n \mid r$

roles

$k' ::= k/R$

Types and kinds in System FC₂

$k ::= *$	$ k' \rightarrow k$	kinds
$R ::= n$	$ r$	roles
$k' ::= k/R$		

Example

Maybe	$:: * / r \rightarrow *$	parametric
Inspect	$:: * / n \rightarrow *$	non-parametric
axiom CoMkAge	$: (\text{Age} \sim \text{Int}) / r$	

Example

Maybe $:: \quad */r \rightarrow *$ parametric

Inspect $:: \quad */n \rightarrow *$ non-parametric

axiom CoMkAge : (Age \sim Int)/r

$$\frac{\begin{array}{l} \Gamma \vdash \gamma_1 : \varphi_1 \sim \varphi_2 \in (\eta_1/R_2 \rightarrow \eta_2)/R_1 \\ \Gamma \vdash \gamma_2 : \psi_1 \sim \psi_2 \in \eta_1/\min(R_1, R_2) \end{array}}{\Gamma \vdash \gamma_1 \gamma_2 : \varphi_1 \psi_1 \sim \varphi_2 \psi_2 \in \eta_2/R_1} \quad \text{CAPP}$$

- $n \leq r$
- With Maybe we can use whatever we like
- With Inspect—nominal role types only

- Roles for differing type application contexts
- Roles as a kind component
- Progress and preservation
- Updated translation rules
- Simplifying System FC

“Typing” type-level computations and System F_C^\uparrow

Vectors with GADTs: Example

Traditional implementation

```
data Zero
```

```
data Succ n
```

```
data Vec :: * -> * -> * where
```

```
  VNil :: Vec a Zero
```

```
  VCons :: a -> Vec a n ->  
          Vec a (Succ n)
```

- Zero :: *
- Succ :: * -> *
- Vec :: * -> * -> *

- `Zero :: *`
- `Succ :: * -> *`
- `Vec :: * -> * -> *`
- No control at the type level!
- `Succ Bool` or `Vec Zero Int` are allowed!

Enriching kinds system with promoted types

[Giving Haskell a Promotion: Yorgey et al., 2012]

```
data Nat = Zero | Succ Nat
data Vec :: * -> Nat -> * where
  VNil :: Vec a Zero
  VCons :: a -> Vec a n ->
           Vec a (Succ n)
```

Enriching kinds system with promoted types

[Giving Haskell a Promotion: Yorgey et al., 2012]

```
data Nat = Zero | Succ Nat
data Vec :: * -> Nat -> * where
  VNil :: Vec a Zero
  VCons :: a -> Vec a n ->
           Vec a (Succ n)
```

- DataKinds, PolyKinds GHC extensions
- Type Nat becomes a kind
- Data constructors Zero and Succ become types

Computations over types (literally)

Computations over types (literally)

Addition over types

```
type family Plus (a :: Nat) (b :: Nat)  
type instance Plus Zero b = b  
type instance Plus (Succ a) b =  
                    Succ (Plus a b)
```

Function over vectors

`vconcat :: Vec a n -> Vec a m ->`
`Vec a (Plus n m)`

`vconcat VNil ys = ys`

`vconcat (VCons x xs) ys =`
`VCons x (vconcat xs ys)`

Type equality *

```
data EqRefl a b where  
  Refl :: EqRefl a a
```

- How to define equality for type constructors, say Maybe?

Kind polymorphism

Type equality *

```
data EqRefl a b where  
  Refl :: EqRefl a a
```

- How to define equality for type constructors, say Maybe?

PolyKinds implementation

```
data EqRefl (a :: X) (b :: X) where  
  Refl ::  $\forall X . \forall (a :: X). \text{EqRefl } a a$ 
```

Syntax of System F_C^\uparrow [Yorgey et al., 2012]

$e, u \quad ::=$

$| x$
 $| \lambda x: \tau. e \mid e_1 e_2$
 $| \Lambda a: \kappa. e \mid e \tau$
 $| \lambda c: \tau. e \mid e \gamma$
 $| \Lambda \mathcal{X}. e$
 $| e \kappa$
 $| K$
 $| \text{case } e \text{ of } \overline{p \rightarrow u}$
 $| e \triangleright \gamma$

Expressions

Casting

$bnd \quad ::= q: \tau \mid w: \kappa \mid \mathcal{X}: \square$

Bindings

ι	$::=$	Base kinds
	\star	Star
	Constraint	Constraint kind

κ, η	$::=$	Kinds
	\mathcal{X}	Kind variables
	ι	Base kinds
	$\kappa_1 \rightarrow \kappa_2$	Arrow kinds
	$\forall \mathcal{X}. \kappa$	Kind polymorphism
	$T \overline{\kappa}$	Promoted type constant

- Kinds can't be classified, there is only one “sort” BOX
- Only $*$ -kinded type constructors are promoted
- No promotion for types with promoted types inside them
- No promotion for types with polymorphic kinds
- No promotion for functions!

- Enriching kind system
- Extending GHC Core to System F_C^\uparrow
- Every required type-theoretic property is guaranteed
- More optimisations available
- Changes in type inference algorithm for Haskell

Explicit kind equality

[Weirich, Hsu, and Eisenberg, 2013]

- Unifying types and kinds: $* :: *$
- Kind equality
- Kinds may depend on types
- Same type-theoretic properties
- Weakening System F_C^\uparrow limitations
- Extension `TypeInType` (GHC 8.0, `Type :: Type`)

GHC Core by 2015

A Specification for Dependently-Typed Haskell

STEPHANIE WEIRICH, University of Pennsylvania

ANTOINE VOIZARD, University of Pennsylvania

PEDRO HENRIQUE AZEVEDO DE AMORIM, Ecole
Polytechnique and University of Campinas

RICHARD EISENBERG, Bryn Mawr College

Presented in ICFP '2017

Design Haskell extension such that:

- no difference between types and terms
- sharing semantics between compile-time and runtime computations

- System DC as backward compatible with System FC
- System D as implicitly typed version of System DC:
 - erasure
 - reconstruction
 - source of ideas for type inference in outer language
- Fully formalized and proved in Coq (SSReflect).

Fixed-size vector: Example

```
data Nat :: Type where
```

```
  0 :: Nat
```

```
  S :: Nat -> Nat
```

```
data Vec :: Type -> Nat -> Type where
```

```
  Nil  :: Vec a 0
```

```
  (:>) :: a -> Vec a m -> Vec a (S m)
```

Type for vector with full info about types

```
data Vec (a :: Type) (n :: Nat) :: Type where
  Nil  :: (n ~ 0) => Vec a n
  (:>) :: ∀ (m :: Nat). (n ~ S m)
        => a -> Vec a m -> Vec a n
```

Type for vector with full info about types

```
data Vec (a :: Type) (n :: Nat) :: Type where
  Nil  :: (n ~ 0) => Vec a n
  (:>) ::  $\forall$  (m :: Nat). (n ~ S m)
        => a -> Vec a m -> Vec a n
```

Function over vectors

```
zip ::  $\forall$  n a b. Vec a n -> Vec b n -> Vec (a,b) n
zip Nil Nil = Nil
zip (x :> xs) (y :> ys) = (x, y) :> zip xs ys
```

- \forall for erasable components
- It is enough to have two clauses

```
zip =  
  \-n:Nat. \-a:Type. \-b:Type.  
  \xs:Vec a n. \ys:Vec b n.  
    case xs of  
      --ALT1  
      --ALT2
```

--ALT1

Nil -> /\c1:(n ~ 0).

case ys of

Nil -> /\c2:(n ~ 0). Nil [a][n][c1]

(:>) -> \-m:Nat. /\c2:(n ~ S m).

\y:b. \ys:Vec b m.

absurd [sym c1; c2]

--ALT2

(:>) ->

\m:Nat. /\c1:(n ~ S m).

\x:a. \xs:Vec a m. case ys of

Nil -> /\c2:(n ~ 0).

absurd [sym c1; c2]

(:>) -> \-m:Nat. /\c2:(n ~ S m).

\y:b. \ys:Vec b m.

(:>) [a][n][m][c1]

((,) [a][b] x y)

(zip [m][a][b] xs ys)

```

zip = \-n. \-a. \-b. \xs. \ys.
  case xs of
    Nil -> /\c1. case ys of
      Nil -> /\c2. Nil [][][]
      (:>) -> \-m. /\c2. \y. \ys.
                                                    absurd []
    (:>) -> \m. /\c1. \x. \xs. case ys of
      Nil -> /\c2. absurd []
      (:>) -> \-m. /\c2. \y. \ys.
        (:>) [][][][]
        ((,) [][] x y)
        (zip [][][] xs ys)

```

--------------------------------------------	--------------------------------------------------------------------------

- definitional equality (many rules)
- Progress and preservation

- System D plus explicit types in abstractions proofs for coercions
- Erasing to System D
- Decidable syntax-directed typing
- Uniqueness of typing
- Evaluation
- Progress and preservation
- No full System FC implementation
